Function	The Busy Output is added to the _NCF011_MoveAbsolute_DINT in this FB.						
description	When the Start (Execute) turns ON, a positioning operation for the axis of the specified the Unit No. (UnitNo						
a comparent	and Axis No. (Axis) is started using the specified Position command (Position) and Speed command (Velocity).						
	Changing the Speed command (Velocity) during positioning by this FB will change the actual operation speed.						
	The Positioning completed (Done) is turned ON when the positioning operation for the FB has been						
	completed. This flag will not be turned ON if the positioning operation is canceled because another operation						
	has been started from a different instance, for a deceleration stop, or because an error has occurred.						
	The Busy flag (Busy) will be set when the Start (Execute) is turned ON.						
	The Busy flag (Busy) will be reset when any of the Positioning completed (Done), Abort (CommandAborted), or Error flag (Error) is turned ON.						
	Even if an error occurs when the input variable is out of the range, etc., the Busy flag (Busy) will be set for at						
	least one cycle.						
	The Error flag (Error) will be turned ON and the Error code (ErrorID) will be output if an error occurs for the FB.						
	This will not occur for error in other FBs or other instances of the FB.						
	These statuses (Done/CommandAborted/Error/ErrorID) will be reset when the Start (Execute) turns OFF. If the						
	Start (Execute) turns OFF before the positioning operation has been completed, the status will be set for at least one cycle when corresponding conditions have occurred.						
	Execute OFF						
	Command						
	speed						
	Busy OFF						
	Error OFF						
Kind of FB	Always execution type.						
definition	Connect the EN input to the Always ON Flag (P_On).						
	The same instance cannot be used in two or more places.						
FB	• Executing this FB during the positioning operation will cause a duplicate start. Positioning operation will be						
precautions	performed to the absolute position specified in Position command (Position) from the point at which the last						
EN input	execution was started. Refer to the <i>Related Manuals</i> for details.     •Connect the EN input to the Always ON Flag (P On).						
condition	If another bit is connected to EN, the FB outputs will be held when the connected bit turns OFF.						
Restrictions	• The following cannot be specified for this FB: "Acceleration/deceleration curve designation", "Forward						
Other	rotation current limit designation" and "Reverse rotation current limit designation". If any of these functions						
	<ul> <li>is required, specify them in advance outside the FB.</li> <li>This FB uses Unit Error Reset, Write Data, Read Data and Save Data Bits of the Position Control Unit (see Note). Therefore, do not turn these bits ON or OFF between the period from the rising edge of EN to the rising edge of ENO. For the same reason, do not use these bits for coil outputs (OUT commands).</li> </ul>						
	•The output variable of FB may not change even if EN is turned ON. In that case, check if any of Unit Error						
	Reset, Write Data, Read Data and Save Data Bit is left ON.						
	• This FB uses the Absolute Movement Bit in the Axis Operating Output Memory Areas. Therefore, do not						
	turn these bits ON or OFF until the operation is completed. For the same reason, do not use these bits for						
	coil outputs (OUT commands).						
	• Starting this FB while the Interrupt Feeding Bit of Axis Operating Output Memory Areas is ON will cause an						
	error.						
	Note:						
	For calculation of bit addresses, these bits are referenced in this FB in the first execution of each instance, and						
	when changing "Unit No. (UnitNo)", "Axis No. (Axis)" of the input variable and set "Start (Execute) ".						

#### ■Variable Tables Input Variables

Name	Variable name	Data type	Default	Range	Description
EN	EN	BOOL			1 (ON): FB started
					0 (OFF): FB not started
Unit No.	UnitNo	INT	&0	&0 to &15	Specify the unit number.
Axis No.	Axis	INT	&1	&1 to &16	Specify the axis number.
Start	Execute	BOOL	0(OFF)		
Position	Position	DINT	+0	-2,147,483,648 to	Specify the target position.
command				+2,147,483,647	Unit: Command units/s
Speed	Velocity	DINT	+0	+0 to	Specify the target speed.
command				+2,147,483,647	Unit: Command units/s
					Changing the value while this FB is in operation will
					change the actual operating speed.

#### **Output Variables**

Name	Variable name	Data type	Range	Description
ENO	ENO	BOOL		1 (ON): FB operating normally 0 (OFF): FB not operating normally •FB not started •Input variable out of the range •FB ended with error •Common Parameters could not be read
Positioning completed	Done	BOOL		Turns ON when the positioning operation has been completed.
Busy flag	Busy	BOOL		1 (ON) indicates that the FB is in progress.
Abort	CommandAborted	BOOL		<ol> <li>(ON): Aborted         It will be aborted when any of the following conditions is met during operation         <ul> <li>Turns ON when the other Move command done (Duplicate Move).</li> <li>Stopped with Decleration Stop or Emergency Stop.</li> <li>Executed Servo Unlock, Deviation Counter Reset on an operating axis.</li> <li>Attempted to execute FB while Servo Unlock, Deceleration Stop, Emergency Stop or Deviation Counter Reset Bit is ON.</li> <li>Detected the Stop Execution Flag is ON.</li> <li>The Absolute Movement Bit is changed by the other FB during Absolute Movement in operation.</li> </ul> </li> </ol>
Error flag	Error	BOOL		Turns ON when an error has occurred in the FB.
Error code	ErrorID	WORD		<ul> <li>Returns the error code when an error has occurred in the FB. Refer to the <i>Related Manuals</i> for details on errors.</li> <li>A code of #0000 will be returned if any of the following conditions is satisfied.</li> <li>Input variable is out of range.</li> <li>The common parameters of the Position Control Units are out of range.</li> <li>Not established communications with a specified axis.</li> <li>The Interrupt Feeding Bit of Axis Operating Output Memory Areas is ON before Absolute Movement is executed by this FB.</li> </ul>

# ■Version History

Version	Date	Contents
1.13	2006.01.	Original production
1.20	2007.11.	The restrictions on the Interrupt Feeding Designation of the Axis Operating Output Memory Areas have been removed.

## ■Upgrade Details

Version	Contents
1.20	In the version 1.13, the Interrupt Feeding Designation of the Axis Operating Output Memory Areas was always monitored. Therefore, an error was output by the FB regardless of an axis status when turning ON the Interrupt Feeding Designation after completing to accept the command to operate an axis. In the version 1.20, it is monitored only when starting an axis operation and not monitored after a positioning operation has started.

### ∎Note

This document explains the function of the function block. It does not provide information of restrictions on the use of Units and Components or combination of them. For actual applications, make sure to read the operation manuals of the applicable products.
